FUTURE IMPROVEMENTS
FUTURE DIRECTIONS

In addition to reflecting on earlier implementations, this section highlights subsequent IT camps conducted between 2023 and 2025 and outlines directions for future expansion. These camps, all delivered by a single instructor, demonstrate the adaptability and scalability of the proposed "team of one" model across emerging technologies, participant demographics, and delivery contexts. Together, these examples provide evidence of how the framework can evolve beyond a single implementation while informing future growth.

Subsequent Implementations (2023-2025)

The following examples summarize subsequent IT Camp implementations conducted between 2023 and 2025, demonstrating how the proposed framework was adapted across emerging technologies, participant groups, and delivery settings. Together, these cases provide evidence of the model's scalability and practical applicability beyond the initial implementation.

IT Camp for Beginners: 3D Printing and Design (Summer 2023): This two-day camp (two hours per day) introduced emerging 3D printing and design technologies to the general public and was hosted at the Durant City Library. More than 60 participants attended, ranging from first-grade students to senior adults. As a direct outcome of the camp, the library began offering 3D printing services to the local community, supporting sustained access to advanced technology in a rural setting. The initiative also strengthened partnerships between the university and local public institutions.

IT Camp: IoT Using Raspberry Pi and Scratch (Early Summer 2024): This one-day, six-hour camp introduced Scratch, Raspberry Pi, and Internet of Things (IoT) concepts to approximately 15 Upward Bound students in grades 10–12. Hosted on campus, the camp leveraged institutional partnerships to support recruitment and participant selection, further illustrating the flexibility of the model.

IT Camp: AI/ML for Beginners (Summer 2024 and Summer 2025): Two one-day (two-hour) camps introduced artificial intelligence and machine learning concepts to students and community members following the releases of ChatGPT 3.5 and 4.5. Attendance ranged from 29 to 32 participants per offering and included learners from fifth grade through senior adulthood, demonstrating broad community interest and accessibility.

Proposed Directions

Building on these experiences, several future IT camp topics are proposed, including drone technology, cybersecurity, robotics, Scratch-based game design (introductory and advanced), unmanned systems, and entrepreneurship-focused STEM camps. These offerings may also serve as a foundation for small-scale educational entrepreneurship, where initial outreach programs evolve into sustainable models, particularly in underserved or rural regions.
These future directions are grounded in lessons learned from prior implementations—especially in logistics, participant engagement, and resource management—and reflect recurring success

across multiple years, topics, and audiences. The use of widely available tools, structured workflows, and reusable artifacts supports the generalizability and replicability of the framework across educational contexts such as community colleges, regional universities, libraries, and other community organizations. Future work may further explore replication in multi-instructor settings, incorporate formal assessment mechanisms, and expand partnerships with K–12 schools and public institutions. Collectively, these contributions offer a structured and actionable model for institutions seeking to implement IT camps, particularly in single-instructor and resource-constrained settings.
